

## Measuring Guide

Helping you find the perfect fit for your books.

In order to ensure a perfect fit regardless of the type of cover chosen its important that all books are measured accurately.

We would recommend firstly measuring the height of the front cover and making a note of this measurement. We would then recommend measuring the width of the front, the width of the spine section and finally the width of the back cover. By combining these 3 widths you will now know the total width of the books and this along with the height of the book will allow you to choose a suitable cover.

Dimensions							
Title	Quantity	Height	Front Cover Width	Back Cover Width	Spine Width	Total Book Width	Cover Size Required
Book A							
Book B							
Book C							

Both our website and brochure clearly detail the maximum dimensions that would be suitable for each cover / roll size. Armed with this table you should now be able pick out the ideal cover and the ideal sized cover.

Some important points to keep in mind when choosing the correct cover from our Clearshield and Rhino range.

### ClearShield

Our Clearshield covers are designed in such a way that there is a 2 millimeter tolerance built into each jacket size. After confirming the ideal jacket size, it's very important that you check that both the height and width of the jacket is suitable.

### Rhino.1

We offer our Rhino covers in 2 varying spine sizes to ensure we cater for as many books as possible. Narrow spines are up to 30mm thick while the larger spine widths are suitable for books from 30mm to 50mm thick. Remember, our Rhino.1 cover can be trimmed to fit any size book perfectly.

### Rhino.2

Our Rhino.2 has a flexible spine portion added to the front cover thus the spine width does not need to be included in your measurements. Remember, our Rhino.2 cover can be trimmed to fit any size book perfectly.

If you are still unsure of which size to opt for then please do not hesitate to contact our sales team who would be more than happy to assist.
